

Plant a minimum of 5 one-inch diameter trees between the tree with the X on it and 100 feet back from the ordinary high water line to recreate the screening that was eliminated with the excessive vegetation removal.

A maximum of 40 feet along the lake and 25 feet back from the ordinary high water line can remain as is. The rest of the shore impact zone (ordinary high water line to 50 feet back) must allow the sapling/shrub layer to regrow. No additional fill to be brought in from the ordinary high water line to 100 feet and the area must be allowed to regrow grass at a minimum, except where the sapling layer is required.
